IN THE CLAIMS:

1. (Currently Amended) A flexible heat exchanger comprising a pair of plane flexible thermoplastic polymer films each of which comprises an aromatic polyimide substrate film showing no glass transition temperature or a glass transition temperature of 340°C or higher and a thermoplastic aromatic polyimide surface film showing a glass transition temperature in the range of 190 to 300°C fixed to the substrate film in such manner that the surface films face each other, which are in part fused together, whereby producing between the polymer films a conduit pattern through which a fluid passes,

wherein said flexible heat exchanger has a thickness in the range of 5 μm to 20 mm.

2-4. (Cancelled)

5. (Currently Amended) The flexible heat exchanger of claim 1, [which has] further comprising a heat conductive film on a surface thereof.

6. (Original) The flexible heat exchanger of claim 5, wherein a flexible film having a heat radiant metal layer on one side is fixed to the heat conductive film.

7. (Original) The flexible heat exchanger of claim 6, which has a heat resistant porous film on a surface having no heat conductive film thereon.

8. (Original) A space vehicle having the flexible heat exchanger of claim 1 on a surface thereof.

9. (Original) An electronic apparatus having the flexible heat exchanger of claim 1 on a surface thereof.

10. (Original) An electronic part having the flexible heat exchanger of claim 1 on a surface thereof.

11. (Original) A solar heat collector having the flexible heat exchanger of claim 1 on a surface thereof.

12. (Previously Presented) A method of manufacturing the flexible heat exchanger of claim 1 which comprises the steps of placing one of the pair of plane flexible thermoplastic polymer films on another of the pair of plane flexible thermoplastic polymer films and fusing both polymer films in part to combine both polymer films together in part to form the conduit pattern between the polymer films.

13. (Previously Presented) A method of manufacturing the flexible heat exchanger of claim 1 which comprises the steps of placing one of the pair of plane flexible thermoplastic polymer films on another of the pair of plane flexible thermoplastic polymer films via a copper foil in a conduit pattern, fusing both polymer films to combine both polymer films together in part, and etching out the copper foil to form the conduit pattern between the polymer films.

14. (Previously Presented) A method of manufacturing the flexible heat exchanger of claim 1 which comprises the steps of placing one of the pair of plane flexible thermoplastic polymer films on another of the pair of plane flexible thermoplastic polymer films via an intervening flexible thermoplastic polymer film from which a conduit pattern is already cut out, and fusing both polymer films on the intervening flexible thermoplastic polymer film to combine both polymer films together in part to form the conduit pattern between the polymer films.

15. (Previously Presented) A method of manufacturing the flexible heat exchanger of claim 1 which comprises the steps of placing one of the pair of plane flexible thermoplastic polymer films on another of the pair of plane flexible thermoplastic polymer films, heating both polymer films in a conduit pattern by applying heat to both polymer films via a heat insulating material in the conduit pattern, and fusing both polymer films to

combine both polymer films together in part to form the conduit pattern between the polymer films.

16. (Previously Presented) A method of manufacturing the flexible heat exchanger of claim 1 which comprises the steps of placing one of the pair of plane flexible thermoplastic polymer films on another of the pair of plane flexible thermoplastic polymer films, heating both polymer films in a conduit pattern by applying heat to both polymer films by means of a thermal head in a reverse pattern of the conduit pattern, and fusing both polymer films on the intervening flexible thermoplastic polymer film to combine both polymer films together in an area other than the conduit pattern to form the conduit pattern between the polymer films.

17. (Previously Presented) A method of manufacturing the flexible heat exchanger of claim 1 which comprises the steps of placing one of the pair of plane flexible thermoplastic polymer films on another of the pair of plane flexible thermoplastic polymer films via a heat-insulating film in a conduit pattern, fusing both polymer films to combine both polymer films together in an area other than the conduit pattern part, and removing the heat-insulating film to form the conduit pattern between the polymer films.

18. (Cancelled)

19. (Previously Presented) The flexible heat exchanger of claim 1, comprising a linear expansion coefficient of MD, TD and an average of MD and TD, in the range of $10x10^{-6}$ to $35x10^{-6}$ cm/cm/°C at 50-200°C.

20. (Currently Amended) A flexible heat exchanger comprising a pair of plane flexible thermoplastic polymer films each of which comprises an aromatic polyimide substrate film comprising polyimide produced from an aromatic tetracarboxylic acid compound selected from the group consisting of 3,3',4,4'-biphenyltetracarboxylic dianhydride and pyromellitic dianhydride and a diamine compound selected from the group consisting of p-phenylenediamine and a combination of p-phenylenediamine and 4,4'-diaminophenyl ether
